

# AVM-6 Instructions

The AVM-6 is a 6 input automatic video switch which senses the presence of a valid video sync signal on the incoming lines. The unit will then switch the highest number input with a video signal to the output.

As an example: if inputs 1, 3, and 5 have video signals on them, the AVM-6 will switch input number 5 to the output automatically since it is the highest number input.

The AVM-6 front panel LEDs will show which input is switched to the output by showing green. A red indication is shown for other incoming signals. When there are no valid signals the input #1 LED will show red.
